The 3 equal signs mean "equality without type coercion".

Using the triple equals, the values must be equal in type as well.

When you declare a local variable, that variable has a scope.

Generally local variables exist only within the block or function in which you declare them.

A closure is a persistent scope which holds on to local variables even after the code execution has moved out of that block.

Functions that operate on other functions, either by taking them as arguments or by returning them, are called higher-order functions.

The querySelector() method returns the first element that matches a specified CSS selector(s) in the document.

Get the first <p> element from the document: document.querySelector("p");
